

THE LONG:

Long-acting clostridial protection – so you can vaccinate earlier and protect lambs for longer.

If you've ever had lambs drop dead from diseases like Pulpy Kidney, you'll know why clostridial protection is so important. 5-in-1 vaccination at pre-lamb dramatically increases lamb survival through to weaning. And the more antibodies they receive, the more protected they'll be.

NILVAX is a 5-in-1 that contains levamisole, which boosts the immune response in ewes, increasing the number of antibodies available to lambs through colostrum. This boosted protection results in **longer-lasting protection for lambs** and **better protection for multiples that share colostrum from one ewe**. Clostridial protection is one of the best things you can do right now to ensure more lambs survive through to weaning. Pick up NILVAX today from your local animal health retailer.

THE SHORT:

A short-acting drench.
